

Collusion and technological innovation – the case of algorithms

Margarida Matos Rosa
President

Autoridade da Concorrência
Portuguese Competition Authority

Developing an analytical framework for the digital economy

- AdC Issues Paper on Digital Ecosystems, Big Data and Algorithms published in July 2019 (in PT and EN).
- Addresses key issues in digital markets that may impact competition:
 - Network effects and multi-sided markets;
 - Digital ecosystems;
 - Data access and data portability
 - Implications for merger evaluation
 - Monitoring and pricing algorithms, and their possible role as facilitators of collusion
- Builds on **recent reports in digital markets**, e.g., Crémer et al. (2019), the Furman Report (2019), Stigler Center (2019).

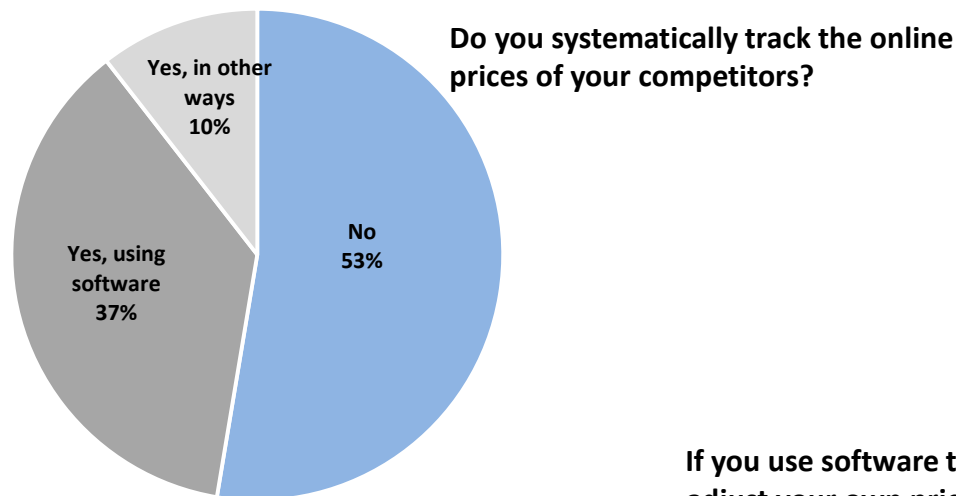

Aims

- **Added focus on Algorithms and implications for undertakings**
- **Advocacy for the PT competition community** as to how AdC views challenges regarding the digital developments for competition policy and enforcement

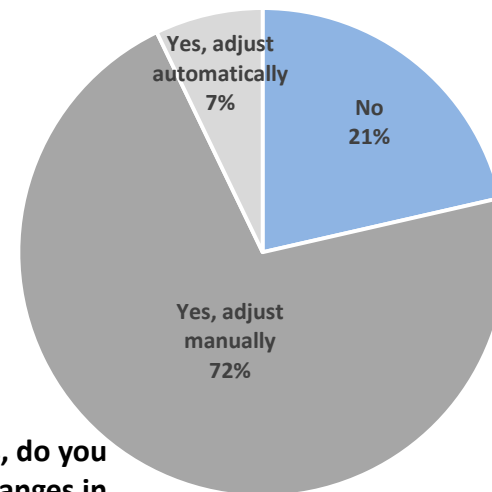

Algorithms and collusion

- Algorithms may change the way competition takes place in the market:
 - Firms may adopt new strategies (e.g., personalised pricing)
 - Firms can do what they already did faster and/or with more information (e.g., monitoring prices)
 - The way firms interact may change (e.g., easier to detect deviations from collusive equilibria)
- The risks introduced by algorithms are especially relevant in markets that are already concentrated.
- The AdC assessed how widespread are monitoring and pricing algorithms among firms operating in Portugal and how they are used through an RFI that allowed collecting info on about 40 firms.

If you use software to track online prices, do you adjust your own prices in response to changes in the online prices of your competitors?

Four ways algorithms may promote collusion:

- Making explicit collusion easier to enforce (e.g. Trod and Topkins)
- Introducing predictability and market transparency (tacit collusion)
- Creating “hub-and-spoke”-like scenarios
- Reaching collusive equilibria on their own

Pricing algorithms in practice

- Examples of what **simple-rule pricing algorithms** may provide to vendors in marketplaces;
- Third-party vendors can set pricing rules *vis-à-vis* other vendors' prices (e.g., undercut; match);
- The algorithm will **monitor other prices and adjust its own prices accordingly**.

Choose How to Reprice Against Your Competition

Price Below ▼ \$/€/£... ▼ 0

Enter the dollar amount or percentage that will be used to reprice you against your competition. The correct currency will be used automatically.

Pricing algorithms in practice

- Third-party vendors can set **minimum prices** and **maximum prices** automatically or manually.

Return On Investment	Profit Margin	Fixed Profit	Enter Your Own Min/Max	Formula Based Min/Max
				
Return On Investment	Profit Margin	Fixed Profit	Enter Your Own Min/Max	Formula Based Min/Max
Calculate minimum and maximum prices to target a specific percentage. Return on Investment (ROI) is profit as a percentage of your cost.	Calculate minimum and maximum prices to target a specific percentage. Profit margin is profit as a percentage of your final sale price.	Calculate minimum and maximum prices using a fixed value to target a specific profit value.	Manually assign your minimum and maximum prices per listing through the Min/Max fields on the listings page or through upload templates.	Automatically calculate minimum and maximum prices using a custom formula you create. Formulas will calculate prices using only the elements you choose to include.

Exclude Amazon as a Seller

Enabled Disabled

Enabling this setting excludes Amazon as competition when they are present on an offer.

Price out of stock listings to max price

Enabled Disabled

Maintain your max price on listings when out of stock. In stock listings will price according to strategy settings

Don't Lower My Price When in the Buy Box

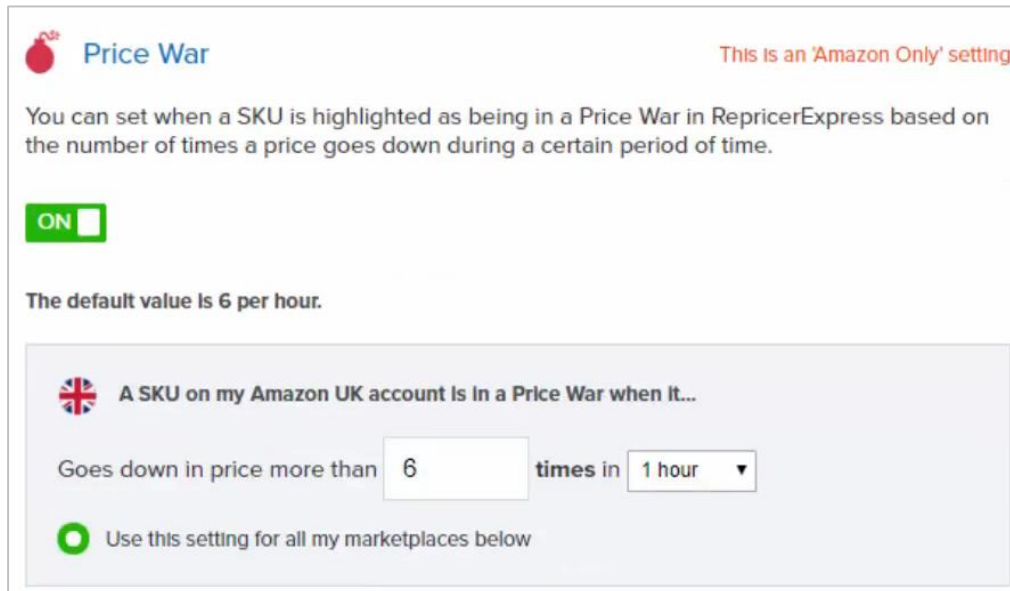

Enabled Disabled

Prevent your price from being lowered when you have the Buy Box, even if there are competitors lower than you.

Source: <https://help.informed.co/strategies/strategy-types/build-your-own>

Detecting and avoiding price wars

- Vendors can set their definition of price war, which will be monitored by the pricing algorithm:

 **Price War** This is an 'Amazon Only' setting

You can set when a SKU is highlighted as being in a Price War in RepricerExpress based on the number of times a price goes down during a certain period of time.

ON ☐

The default value is 6 per hour.

 A SKU on my Amazon UK account is in a Price War when it...

Goes down in price more than times in

☒ Use this setting for all my marketplaces below

 repricerexpress

Repricing on Amazon: How to Avoid a Price War

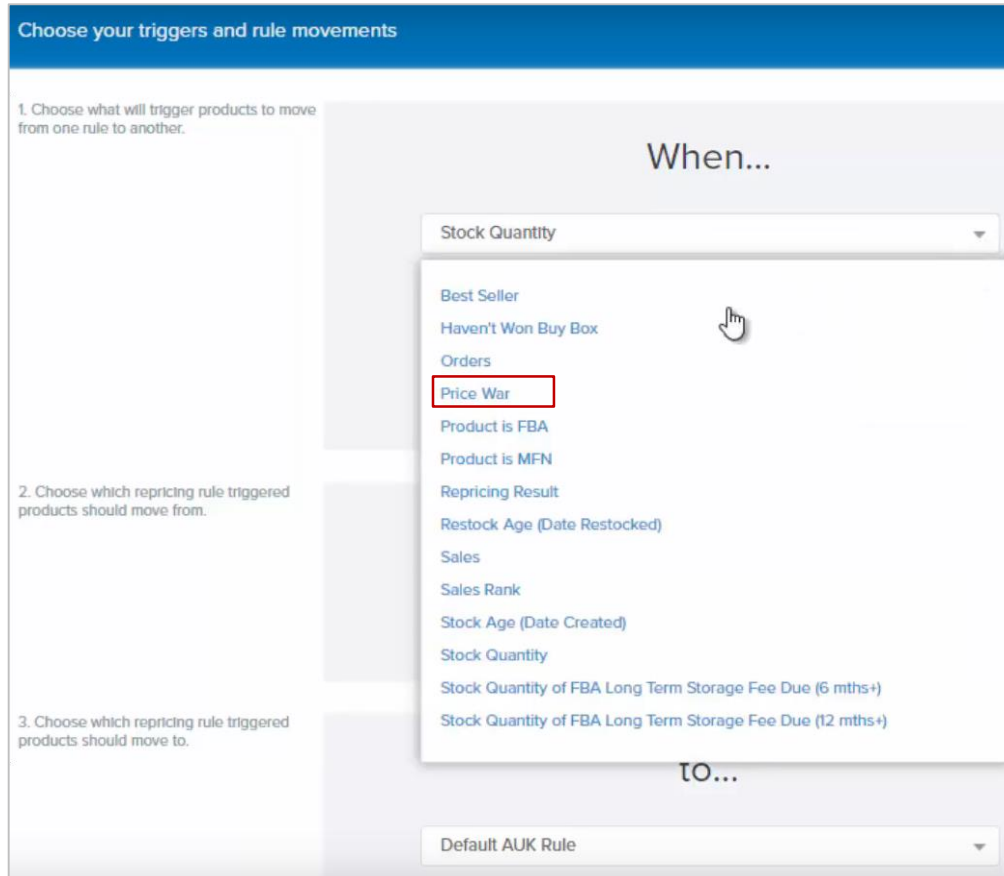

We all know price has a lot to do with winning a share of Amazon's Buy Box, but perhaps merchants place a little too much importance on price. Instead of worrying so much about having the lowest costs among your competitors, [RepricerExpress](#) recommends [avoiding a price war](#) as a technique for coming out on top. It rarely works out for the best, and we'll take a look at why that is.

Source: <https://www.repricerexpress.com/avoiding-price-war-on-amazon/>

Detecting and avoiding price wars

- If the algorithm detects a price war, several strategies and rules may be triggered (pricing regimes), namely less aggressive ones:

Choose your triggers and rule movements

1. Choose what will trigger products to move from one rule to another.

When...

Stock Quantity

- Best Seller
- Haven't Won Buy Box
- Orders
- Price War**
- Product is FBA
- Product is MFN
- Repricing Result
- Restock Age (Date Restocked)
- Sales
- Sales Rank
- Stock Age (Date Created)
- Stock Quantity
- Stock Quantity of FBA Long Term Storage Fee Due (6 mths+)
- Stock Quantity of FBA Long Term Storage Fee Due (12 mths+)

2. Choose which repricing rule triggered products should move from.

3. Choose which repricing rule triggered products should move to.

TO...

Default AUK Rule

“Putting the algorithm to sleep”

- Pricing algorithms can be **put in sleep mode** during certain periods, and even be reset to max price, to **prevent unexpected price fluctuations (e.g., price wars)**:

Sleep Mode ☒ Enable

Please note that products set to 'Do Not Reprice' under *Scenario settings* will not be included in *Sleep Mode settings*.

All sleep mode times and schedules are based on [your time zone settings](#).
The local time in your chosen time zone is 11:41am - (GMT + 1) Dublin, Edinburgh, Lisbon, London

Stop repricing at: ☐ AM ☐ PM

Restart repricing at: ☐ AM ☐ PM

☐ [Reset to Max prices during Sleep.](#)

Choose to switch repricing off at a certain time every day and/or reset to maximums. [More info](#)

- The developers claim this feature may be used ***“if you want to force your competitors’ prices to increase by increasing your own price overnight”***.

“The race to the bottom - EVERYONE LOSES. Please read

I am here to teach you all some things. (...)

*The race to the bottom is a race that EVERYONE loses. **STOP REPRICING YOUR STUFF INTO OBLIVION.***

What do I mean? I mean when you reprice your product to a penny below the next person. Then that person reprices his price to a penny below you. Then the next 5 guys all do the same thing, then you log in one day and see that you’re 10 cents above everyone else, so you drop your price 11 cents and the cycle begins all over again...

This happens until SOMEONE realizes they’re pointlessly losing \$1 per unit and stops, then the next guy realizes he’s losing \$1.01. Then the next guy realizes he’s losing \$1.10... But guess what. NONE of you will reprice UPWARDS to recover that lost dollar because you worry the next guy won’t do the same - which he probably won’t because he’s fearing the same thing as you.

*So **why the repricing?** It’s because these novice sellers (...) think that by repricing a penny below the lowest person will magically make your sales sky rocket. I have news for you. It WON’T. (...)*

*So please people, remember these two points when you do competitive repricing. Consider these following alternatives to **penny wars**:*

***MATCH the lowest person’s price rather than attempting to undercut them. Undercutting is a win for no one other than the buyer, who will save a few pennies on your price, but you’ll lose hundreds because you have 800 of them in stock**”.* (emphasis added).

“Repricers and their perils

This is just a rant.

*So there is a new seller on some of my best selling listings and he is FBA and has the repricer set to undercut. Other's have set to match. So this guys undercuts and others match. Result: **very fast march to bottom!** I know very well their price points and **am shocked to see sellers being so irresponsible**. This seller is new, I get it but the other more experienced sellers also seem to have no bottom price. On listings where there are good number of FBA sellers, now it is going to take months for it all to clear out. I can set 10% lower and they will come down fast, but I do not want to keep doing it as I do not want to risk any policy violation! I have heard of how repricers are dangerous and can set ur price to a penny, but I feel the most dangerous aspect of repricers is their use by people who do not know their margins!*

I know that talking pricing is illegal and will not do so. But can I contact this crazy seller and just tell him this:

«Hello,

*I see u have a repricer on that undercuts the lowest FBA offer. **When u undercut, the others match, and then u again undercut and so on. The result is loss of profitability for everyone. Now your price is your choice and this message is in no way an attempt to fix pricing.** You set your price to whatever you like but I just wanted to send you a message on what I observed on the listings you are on and share my thoughts with you.»*

Please advise me if it will be OK to send such a message or is it considered an attempt at price fixing. (...)”. (emphasis added).

Who is responsible?

The AdC has **warned that firms are responsible for the algorithms they use** and that using them to coordinate strategies in the market is **not compatible** with Portuguese competition law.

PSD2 – Data access and data portability

- AdC Issues Paper develops on the **pioneering example of data portability: PSD2** (Second Payment Services Directive)
- **PSD2 requires that banks grant access to client data to Third Party Providers (e.g., FinTech start-ups)**, upon client consent, according to Regulatory Technical Standards approved by the EC.
- Setting up regulation and standards for data portability encompasses challenges
- The AdC has published in 2018 a **FinTech Issues Paper**, identifying a risk of foreclosure of access to data to FinTech newcomers, by incumbent banks.
- E.g., **incumbents could exploit consumer inertia** by creating unnecessary hurdles in the customer journey for giving consent; curtailing coverage of data provided; among others
- AdC recommended that secondary regulation (to follow PSD2) should account for these aspects, as these strategies may hamper competition by newcomers
- E.g., Guiabolso investigation in Brazil (<https://bit.ly/2mDm4Gc>)

Behavioural considerations

- The AdC emphasises the role of behavioural considerations
- **Consumer behavioural biases** may play in curtailing competition in digital markets.
- It is often said that “**competition is a click away**” (e.g., Eric Schmidt from Google).
- But it may rather be that “**exclusion is a click away**”:
 - Adding extra steps to access a product
 - Deranking results in search results pages
 - Default options

Heatmap of where people look in search results pages
“F pattern”
